2006

Environment
Agency

What have we learnt so far?

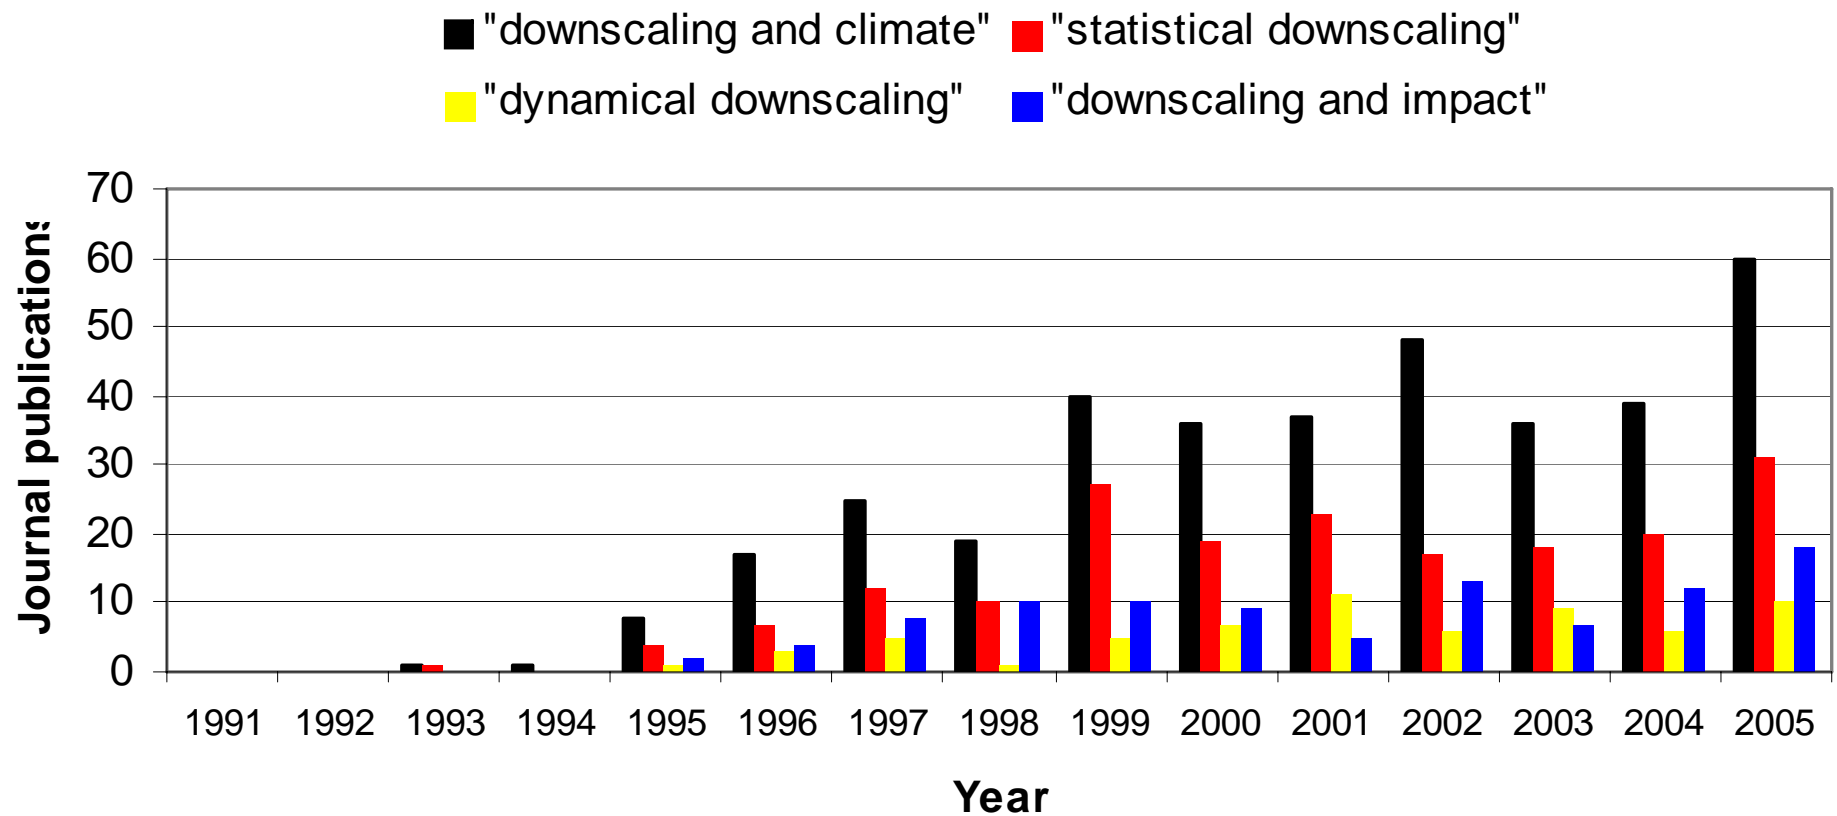

- GCM boundary conditions are the main source of uncertainty affecting all downscaling methods
- Statistical and dynamical downscaling have similar skill
- Different downscaling methods yield different scenarios
- There are no universally “optimum” predictor(s)/domains
- Downscaling extreme events is highly problematic (for example summer rainfall predictability is very low)
- Traditional skill measures for current climate may not be the best guide to future scenarios of *change*

Concluding remarks

1996
2006

Environment
Agency

Six challenges ahead

- Shifting from theoretical downscaling studies to support for climate change adaptation
- Promoting best practise and case studies where downscaling is actually shaping decision-making
- Downscaling within probabilistic frameworks
- Representing uncertainty in terms of *timing*
- Addressing technical challenges of extreme events
- Translating new insights of uncertainty into *practical* guidance for decision-making
