

User wants to access S2 via S1 (e.g. ssh and NFS)

1) User's credentials to AAA server + delegation info (may restrict S1->S2)

2) KDC grants user the TGT (using IAKERB?)

3) User gets TGT

4) S1 gets TGT too? (some kind of restricted TGT?)

5) S1 uses its restricted TGT to access S2. ( It has to get client-service ticket using TGT somehow )
